Integrating Bicycling and Public Transport in North America

*John Pucher, Rutgers University
Ralph Buehler, Virginia Tech*

Abstract

This paper provides an overview of bike-transit integration in large American and Canadian cities. It begins with an analysis of national trends in bike-and-ride programs such as the provision of bike racks on buses, accommodation of bikes on rail vehicles, and bike parking at rail stations and bus stops. Most of the paper, however, is devoted to case studies of bike-transit integration in six large American cities (San Francisco, Portland, Minneapolis, Chicago, Washington, and New York) and two Canadian cities (Vancouver and Toronto). Much progress has been made over the past decade in coordinating cycling with public transport, but the demand for bike-and-ride far exceeds the supply of facilities in some cities. More funding, in particular, is needed to provide more secure, sheltered bike parking at rail stations and to increase bike-carrying capacity on rail vehicles.

Introduction

Coordinating bicycling with public transport is mutually beneficial, enhancing the benefits of both modes and encouraging more bicycling as well as more public transport use (Brons et al. 2009, Givoni and Rietveld 2007, Hegger 2007, Martens 2004 and 2007, TRB 2005, U.S. DOT, 1998). Bicycling supports public transport by extending the catchment area of transit stops far beyond walking range and at much lower cost than neighborhood feeder buses and park-and-ride facilities for cars. Access to public transport helps cyclists make longer trips than possible

by bike. Transit services also can provide convenient alternatives when cyclists encounter bad weather, difficult topography, gaps in the bikeway network, and mechanical failures.

In the past, bike-and-ride in North America was limited by low overall levels of cycling and public transport use in most cities, just the reverse of the situation in northern Europe (Bassett et al. 2008, Hegger 2007, Martens 2007, Pucher and Buehler 2008). In recent years, however, both cycling levels and public transport use have risen sharply in the U.S. and Canada, and bike-and-ride trips have been increasing as well. Indeed, in some cities it has been so successful that the demand for bike-and-ride facilities exceeds the available supply (TRB 2005, U.S. DOT 1998).

This paper describes the programs and policies currently being implemented in North America to integrate bicycling with public transport. It starts off with a brief overview of the various kinds of integration and the extent of their implementation. Most of the paper, however, is devoted to case studies of bike-transit integration in two large cities in Canada (Toronto and Vancouver) and six large cities in the U.S. (San Francisco, Portland, Minneapolis, Chicago, Washington, DC, and New York City). The case study analysis compares the type and extent of integration measures undertaken in the various cities, noting the strengths and weaknesses of each city's integration policies. The paper concludes by identifying the most innovative and successful policies in the eight cities and offers policy recommendations for future improvements.

North American Trends in Bike-Transit Integration

In recent years, levels of cycling and public transport use have reached record highs in both the U.S. and Canada. Between 1995 and 2008, public transport trips rose by 38 percent in the U.S. and by 46 percent in Canada (APTA 2009a and 2009b). Similarly, levels of cycling have increased considerably since 1990. In the U.S., the total number of bike trips to work increased by 32 percent from 1990 to 2005-2007 (averaged) (U.S. Census Bureau 2009a and 2009b). Over the shorter period 1996 to 2006, the number of bike trips to work in Canada rose by an even larger 42 percent (Statistics Canada 2009).

While rising public transport use and increased cycling have provided the rationale for more bike-transit integration, federal funding in the U.S. has provided the necessary financing for a wide range of projects implemented in recent years at the

state and local government levels (Clarke 2003, Thunderhead Alliance 2007, TRB 2005, U.S. DOT 1998). Indeed, the federal government finances some categories of bike-transit integration projects with an especially high 95 percent federal share. There is no federal funding for urban transport in Canada, but provincial and local governments have provided large increases in funding for public transport and bicycling in recent years, including projects aimed at better integration (CUTA 2008, Pucher and Buehler 2006, Transport Canada 2006).

As documented in this article, virtually every large city in the U.S. and Canada has undertaken a range of measures to promote bike-and-ride. There are five main categories of measures to promote bike-transit integration:

1. provision of bike parking at rail stations and bus stops, with different degrees of shelter and security
2. multi-functional bike stations providing not only parking but also a range of services such as bike rentals, repairs, parts and accessories, bike washing, showers and lockers, and touring advice
3. bike racks on buses, usually exterior, but occasionally interior storage
4. bikes on board vehicles, usually rail vehicles, sometimes with special bike racks, hooks, or even bike cars on trains
5. bike paths, lanes, and on-street routes that lead to public transport stations and stops, thus facilitating the bike's role as feeders and collectors for public transport

Extent of Bike-and-Ride Facilities in North America

The only available national statistics on bike parking at public transport stops are from recent surveys of 272 American and Canadian transit systems by the American Public Transportation Association (APTA 2006 and 2008a). In the U.S., the supply of bike parking spaces in 2008 was 24,178 at rail stations, 9,005 at bus stops, and 176 at ferry terminals. For the same year, Canadian systems reported 2,892 bike parking spaces at rail stations and 481 at bus stops. Between 2006 and 2008, the supply of bike parking increased by 67 percent in Canada and 26 percent in the U.S. (APTA 2006 and 2008a).

Unattended bike lockers are the main form of secure bike parking at North American public transport stops. Of the 56 large American and Canadian transit systems surveyed by the Transportation Research Board (2005), 14 systems provided bike

lockers at some of their rail and bus stops, but the actual number of lockers was not reported. The same TRB survey reported eight staffed bike parking stations in 2005, mainly on the West Coast. A few more bike stations have opened since then (Litman 2009).

By far the most important form of bike-transit integration in North America is bike racks on buses. That is not surprising since 60 percent of all public transport trips in the U.S. are by bus (APTA 2009b). Bike racks are inexpensive to install, easy to operate, and do not take up space on the vehicles themselves (TRB 2005). The 2005 TRB survey found that systems throughout the U.S. and Canada provide bike racks on buses and that most systems have eliminated fees they had previously charged for rack use. As shown in Figure 1, the percentage of buses with bike racks almost tripled in the U.S. in only eight years, from 27 percent in 2000 to 71 percent in 2008 (APTA 2008b and 2009a).

Source: APTA, *Public Transportation Factbook 2008*, Table 23

Figure 1. Trend in Percentage of Buses with Exterior Bicycle Racks in the U.S., 2000-2008

Another important form of bike-transit integration is the permission to take bikes on board public transport vehicles, since that enables cyclists to ride their bikes to and from public transport stops at both ends of their trips. Few public transport systems permit bikes to be taken on board buses unless they are compact, folding bikes, but most systems permit bikes on light rail, metro, and suburban rail trains, except during

peak hour periods when crowding makes this infeasible (TRB 2005). Moreover, an increasing number of public transport systems are providing special accommodations for bikes on trains, such as bike racks, bike hooks, special bike holding areas near the doors, and even special bike cars—although rarely (APTA 2008b; TRB 2005).

The last aspect of bike-transit integration is the coordination of bike routes with public transport stops. No national statistics are available on the extent of implementation, and it would be hard to quantify at any rate. Nevertheless, the eight case studies qualitatively assess this aspect of bike-transit integration in each of the cities.

Case Studies of Bike-Transit Integration

All eight of the case study cities are large, but they vary considerably in metropolitan area population, ranging from 2.2 million in Portland, Oregon to 18.2 million in New York City. The cities also vary widely in their geographic locations, climate, and topography. Most important for this study, they vary greatly in the share of trips covered by bicycling and public transport, as shown in Figures 2 and 3.

Figure 2. Public Transport Share of Work Trips in U.S. and Canadian Cities and Metropolitan Areas, 2006/2007

Sources: U.S. Census Bureau (2009b) and Statistics Canada (2009)

Figure 3. Bicycling Share of Work Trips in U.S. and Canadian Cities and Metropolitan Areas, 2006/2007

In 2006, public transport shares of work trips for central city residents ranged from only 11 percent in Portland to 55 percent in New York (Figure 2). Public transport trip shares for metropolitan areas ranged from 4 percent in Minneapolis to 30 percent in New York. Without exception, public transport use is higher in all eight central cities than in their suburbs.

Levels of cycling also vary greatly among the eight cities (Figure 3). Portland (3.9%) and Minneapolis (3.8%) had the highest bike mode shares of work trips in 2006, but Vancouver (3.0%) and San Francisco (2.8%) were not far behind. By comparison, cycling to work in New York (0.7%) and Chicago (1.1%) is rare. Similar to levels of public transport use, bicycling is much higher in central cities than in the suburbs.

There are no comparable statistics on levels of bike-and-ride in each of these cities, since the most recent American and Canadian national travel surveys report only the main mode of transport for the work trip. Figures 2 and 3 provide useful background, however, by portraying the overall levels of cycling and public transport in the eight cities and their corresponding metropolitan areas. In general, the higher the levels of both cycling and public transport use, the greater the potential for bike-transit coordination (Hegger 2007, Rietveld 2000, Martens 2004 and 2007).

Variations in Bike-Transit Integration

Efforts to integrate cycling with public transport vary greatly among the eight case studies. New York City, for example, has done little to promote bike-and-ride, while San Francisco, Vancouver, and Portland have implemented the entire gamut of integration measures. The following section highlights the most important aspects of bike-and-ride policies in each city, noting in particular the strengths and weaknesses of current policies.

Unless otherwise indicated, the information for these case studies was obtained by the authors directly from bicycling planners, public transport systems, metropolitan planning organizations, city transport departments, and non-governmental cycling and sustainable transport organizations in each metropolitan area. The same panel of transit and cycling experts also reviewed the case studies of their cities at several stages to check for accuracy, consistency, and completeness.

San Francisco

The San Francisco Bay Area has been a leader in bike-transit integration efforts in North America. Bay Area Rapid Transit (BART) provides bike parking at almost all 43 stations, with a total of 4,313 bike parking spaces in 2009, including 1,010 in secure bike lockers. To increase convenience and flexibility, BART has been introducing electronic bike lockers (294 as of 2009), which are available on a first-come, first-served basis and do not require advance subscriptions. Caltrain, the suburban rail line from San Francisco south to Palo Alto and San Jose, provides bike parking at all 32 stations, with a total of 1,100 bike lockers and 400 bike racks.

The San Francisco Bay Area had five of the ten bike stations in the U.S. in 2009: 226 bike parking spaces at two Caltrain stations and 433 spaces at three BART stations. Utilization rates of the bike stations vary widely, from over 100 percent at the Berkeley BART station to only 11 percent at the Palo Alto Caltrain station. BART will soon triple the size of the Berkeley bike station and move it above ground to increase accessibility.

(Insert shows smart card used to access lockers)

Source: Bay Area Rapid Transit

Figure 5. Bike Station at Berkeley
BART station is filled to overflowing but will soon be tripled in size to accommodate high demand for bike and ride.

Cyclists prefer to take bikes on board, however. A 2008 survey found that 72 percent of bike-and-ride passengers carried their bikes with them, compared to only 28 percent who parked them at BART stations. Bikes are allowed on BART trains except during peak hours in the peak direction. Although Caltrain has no time restrictions, cyclists are often denied boarding on rush hour trains because all bike spaces are already occupied. Neither BART nor Caltrain charge a fee for bringing bikes on board. Moreover, Caltrain's lead cars provide special accommodations for 16-32 bikes, depending on time of day and direction of travel. Most of the numerous ferry lines in the Bay Area also permit bikes on board with no extra fee. Folding bikes are allowed on BART and Caltrain at all times, but are not permitted on board San Francisco's MUNI buses, streetcars, cable cars, and light rail vehicles. Complementing bike access to BART and Caltrain services, virtually all buses of all public transport systems in the San Francisco Bay Area are equipped with bike racks, free of charge to cyclists.

Due to the extensive and fine-grained network of bus and rail routes in San Francisco, bike routes often lead to public transport stops, even without any explicit coordination. Outside of San Francisco, where public transport routes and stations are farther apart, many communities make an explicit effort to coordinate bike routes with key stops.

Overall, bike-transit integration efforts in the San Francisco Bay Area have been successful. The percentage of public transport trips combined with cycling has more than tripled since 1990. Nevertheless, several problems remain. For example, it is difficult for cyclists to get across the San Francisco Bay during rush hours, since bikes are prohibited from BART trains in peak directions and not permitted on the Bay Bridge. Similarly, Caltrain has problems accommodating bikes on board in the peak hour and often denies boarding to cyclists.

Portland

Bike-and-ride in Portland mainly involves bikes on transit vehicles. TriMet, Portland's public transport system, estimates that 10 times more bikes are taken on their LRT vehicles than parked at LRT stations (2,100 vs. 200 per weekday). There are no fees, no permit requirements, and no time of day or directional restrictions for taking bikes on LRT vehicles. Every train has a low-floor car especially designed to facilitate bike access, with waiting areas and four bike hooks located near the doors. But passengers without bikes have priority to board crowded trains. All buses in the Portland area have bike racks, another inducement for cyclists to ride with their bikes instead of parking them.

By comparison, Portland does not provide much bike parking at train and bus stops. In 2009, there were a total of 670 bike parking spaces at TriMet LRT stops and transit centers (major transfer hubs for several bus or LRT lines). Of those, almost half were bike lockers. In addition, there were city-owned bike lockers at 15 locations in downtown Portland, most of which were near bus or rail services. Portland does not have any bike stations, which is surprising given its high bike mode share and wide range of other pro-bike policies and programs. Bicycling planners and public transport officials plan to improve bike parking at transit stops by installing 196 bike lockers and 168 bike racks at LRT extensions.

Portland cyclists prefer taking their bikes on board transit vehicles. A survey by TriMet indicated that 76 percent of cyclists would not be willing to park their bikes at a transit stop even if there were sheltered and secure bike parking available. The advantage of taking bikes on buses or rail vehicles is that bikes can then be used at both ends of the transit trip. It also reduces the risk of bike theft and vandalism.

Portland carefully and explicitly coordinates its bikeway network with its public transport network. Bike routes are designed to facilitate access to public transport stops. Most transit centers are served by multiple bikeways. Moreover, city planners give special consideration to enhancing bike access to transit stops in outlying areas too far away from the city center for most people to cover by bike alone.

Vancouver

Metro Vancouver's unique advantage for bike transit integration is TransLink, the fully integrated, multi-modal regional transportation authority. Unlike the other case studies, public transport, major roadways, and bicycling in Vancouver are all handled within the same agency. The coordination of cycling and public transport is obvious and natural in such a multi-modal agency, as reflected in TransLink's plans, funding, construction projects, vehicle procurement, and operating procedures. Over the past 10 years, TransLink has spent more than \$12 million specifically on bike-transit integration.

As in the San Francisco and Portland areas, all buses in Metro Vancouver are equipped with bike racks. Similar to San Francisco's BART, bikes are allowed on Vancouver's SkyTrain except during peak hours in the peak direction due to problems of overcrowding. Until recently, there were no special accommodations for bikes on SkyTrains, but all future vehicles will provide a special area for bikes in the rear of each car with a leaning rail and fold-up seats. Bikes are allowed at all times on West Coast Express trains for a \$0.50 charge. SeaBus ferries permit bikes on

board at all times without charge. Almost all of TransLink's rail and ferry services are fully accessible through elevators, ramps or level boarding, thus facilitating bike-and-ride.

Source: TransLink

Figure 6. Easy Access for Bikes on SkyTrain in Vancouver

There are bike racks at all SkyTrain and West Coast Express rail stations as well as park-and-ride lots and transit nodes with interchanges of several bus or rail lines. In 2008, Vancouver had a total of 1,060 parking spaces at transit stops: 660 spaces in racks and 400 secure bike lockers. TransLink plans to increase the overall supply of bike parking at transit stops in the coming years, with a special focus on improving the quality of bike parking, especially secure short-term bike parking.

TransLink explicitly coordinates bike routes with public transport. For example, the construction of three new SkyTrain lines included traffic-protected, parallel bike routes to foster bicyclist access to public transport. Another aspect of TransLink's multi-modalism is the focused promotion of cycling in central corridors where bus and rail vehicles are the most crowded, and where cycling has the potential to divert some of the overload and reduce crowding. That coordination

of demand and supply between the two modes is rare and emphasizes the advantages of multi-modal agencies such as TransLink.

Minneapolis

Although Minneapolis is, by far, the coldest of the eight cities, it has the second highest bike share of work trips, almost as high as Portland's (3.8% vs. 3.9%). Public transport's share of work trips is slightly higher in Minneapolis than in Portland (13.4% vs. 11.2%), but much lower than in any of the other cities (Figure 2).

Metro Transit had 497 bike parking spaces at its light rail and bus stops in 2007: 271 spaces in bike racks and 226 bike lockers. Minneapolis has a staffed bike station, the Midtown Bike Center, with 100 bike parking spaces, repairs, rentals, and a café. It is only a block from the Chicago and Lake Streets transit hub, which serves two of the city's busiest bus lines.

Source: Metro Transit

Figure 7. All Buses in Minneapolis have Bike Racks

All Metro Transit and suburban transit buses are equipped with exterior bike racks, and the city has five stationary bike racks for first-time users to practice loading their bikes. Every light rail vehicle has interior vertical racks that accommodate four bikes. Bike-and-ride has become increasingly popular in Minneapolis. Metro Transit surveys in spring 2007 and fall 2008 found a doubling in the number of bicycles transported on bus racks and a 41 percent increase in bikes on light rail.

There is no explicit policy of coordinating bike routes and transit stops in Minneapolis, and City officials emphasize the need to improve cycling facilities feeding into public transport stops.

Figure 8. Vertical Bike Racks on Every Light Rail Vehicle in Minneapolis

Chicago

With the second largest transit system in the U.S., Chicago has made impressive efforts to integrate cycling with public transport. Its special distinction lies in the innovative provision of bike parking at rail stations, tailoring the design of parking facilities to each station's particular situation. With 6,420 parking spaces at its rail

stations, Chicago has about the same amount of bike-and-ride parking as the San Francisco Bay Area and far more than other cities in North America.

There are 2,153 bike parking spaces at 131 of the 143 CTA subway and elevated rail stations and 4,267 spaces at 50 of the 76 Metra suburban rail stations. Moreover, indoor or sheltered parking is available at 83 CTA stations, more than any other transit system in North America. The specific location of bike racks inside the stations provides both weather protection and greater security, since they are usually placed within easy sight of station attendants and other passengers. Chicago is currently installing additional sheltered bike parking for 382 bikes at four CTA stations, and the city has funding to install bike shelters for 250 more bikes in 2010.

Source: Chicago Transit Authority

Figure 9. Indoor Bike Parking on Concourse of CTA Rail Station in Chicago

The largest bike station in the U.S. is located in Chicago’s Millennium Park, immediately above the terminal station for two of Chicago’s suburban rail lines. The bike station is easily accessible from downtown Chicago and the 18-mile Lakefront Trail. It provides secure, indoor parking for 300 bikes as well as convenient lockers, showers and towel service, bike rentals, bike repairs, and guided bicycling tours.

All of Chicago's buses have bike racks, including CTA buses and PACE suburban buses. Bikes are permitted on CTA and Metra trains except during weekday rush hours. As in most of the other cities, no fees or permits are required for the use of bike racks on buses or for bringing bikes on trains.

The biggest challenge to bike-transit integration in Chicago is the difficult access to train platforms. Because most of the rail lines are so old, only 54 percent of CTA stations and 68 percent of Metra stations are ADA accessible. Thus, cyclists are often forced to carry their bikes up long flights of stairs. Few stations have elevators, and cyclists are not permitted to use escalators.

Chicago DOT, transit agencies, and the cycling community are aware of these problems and have made improvements in bike-transit integration a top priority. Chicago's Bike Plan 2015 sets goals of further expanding and improving bike parking inside and outside of rail stations, remodeling stations to make them more accessible to bikes, providing more park-and-ride facilities, and establishing a second bike station with better transit connections.

Toronto

With more than 15,000 post-and-ring bike racks throughout the city, Toronto has more bike parking than any other city in North America. That includes bike parking at almost all rail stations. In 2008, there were 1,192 short-term spaces in bike racks at Toronto Transit Commission (TTC) subway stations and 579 short-term spaces in racks at GO Transit suburban rail stations.

Yet there is a severe shortage of secure parking, with only 114 bike lockers in the entire transit network. Consequently, Toronto plans on greatly expanding the supply of secure parking in 2009 and 2010 through installation of more bike lockers and completion of a new bike station at Union Station, the main transit hub in downtown Toronto, providing bus, streetcar, subway, and suburban rail connections. The bike station will provide secure, sheltered parking for 200 bikes. Construction of an even larger bike station at City Hall is planned to begin in 2010. That facility will be close to several bus and streetcar lines. The GO Transit suburban rail system is improving its bike parking by expanding sheltered parking to all stations by the winter of 2009-2010.

As in most cities with high levels of rail transit use, bikes cannot be taken on TTC subways and streetcars during weekday peak hours. Even when permitted, there are no special provisions for bikes on TTC subway cars. Similarly, bikes are not allowed on any GO Transit trains headed toward or leaving Union Station in

the peak periods. Folding bikes are permitted on all public transport vehicles at all times. Bike access to rail transit is limited by the lack of elevators in most subway stations. Only 41 percent of TTC subway stations are wheelchair accessible, while 75 percent of GO Transit stations are accessible, either through elevators or ramps.

Toronto is making rapid progress equipping its buses with bike racks, which can be used at any time, even during peak periods. In 2008, only 55 percent of TTC buses had bike racks, but all new buses have racks, and every month about 40 older buses are retrofitted with racks. By the end of 2010, all TTC and GO Transit buses will have bike racks, thus facilitating bike-and-ride throughout the region.

There is almost no explicit coordination of bike routes with transit routes and station stops. The many transit stations and fine-grained street network in much of the central city facilitate bike access to TTC stations. In suburban areas, however, many streets are circuitous and do not connect across arterials, making it difficult for cyclists to avoid major arterials while en route to a transit station.

Washington

Bike parking is available at almost all of Washington's 86 Metrorail subway stations, with a total of 1,800 bike racks and 1,300 bike lockers. The parking facilities are popular, with usage rates at most stations ranging from 50-100 percent. In October 2009, a new bike station with spaces for 150 bikes will open next to Union Station, providing convenient connections to Metrorail as well as suburban trains leaving from Union Station. The bike station will also offer bike rentals, repairs, and accessories as well as storage lockers and changing rooms.

In 2008, a new bike-sharing program began in Washington, similar in technology to the Velib system in Paris, but on a much smaller scale: only 120 bikes compared to over 20,000 bikes in Paris. It facilitates bike-and-ride because 8 of the 10 bike-sharing docking stations are at Metrorail stops. The short-term rental bikes can be used to get to and from Metrorail stations, thus serving as feeders and distributors for transit.

Bikes are allowed on Metrorail trains except during morning and afternoon rush hours on weekdays. All 86 Metrorail stations have elevators (271 in total) and are ADA accessible, which facilitates access to platforms for cyclists as well, who are, in fact, required to use the elevators and are not permitted on escalators. In contrast to Metrorail, MARC suburban trains never allow full-size bikes on board, and VRE allows bikes only on certain trains. Both rail systems allow folding bikes at any

time. All 1,450 WMATA buses have bike racks, but some buses run by suburban agencies do not.

In theory, bike plans for the Washington area establish the goal of coordinating bike routes with transit routes, but, in fact, nothing has really been accomplished in this area except by accident.

New York City

New York's transit systems have done little to promote bike-transit integration, far less than any other city in this study. The Metropolitan Transportation Authority (MTA) does not provide bike parking of any kind at the city's 467 subway stations, so the only option for cyclists is to park on nearby sidewalks. The MTA's suburban railroads, the Long Island Railroad (LIRR) and Metro-North Railroad (MNR), offer bike parking at some of their stations, but MTA has no information on the total number of spaces (MTA 2009).

Compounding the problem of insufficient bike parking along the many subway and suburban rail lines of the MTA, there is no secure bike parking at any public transport terminals in Manhattan. Train, bus, and ferry terminals do not even offer short-term parking in bike racks. Thus, cyclists must seek out the occasional bike rack on sidewalks within a few blocks of the terminals or lock their bikes to traffic signposts, lampposts, or other stationary objects.

NYC subways are unique in permitting bikes on board trains at all times, but it is difficult to get bikes to the platforms. Only 16 percent of New York's subway stations are ADA accessible via elevators or ramps. At the remaining 84 percent of stations, cyclists must carry their bikes up and down long flights of stairs, as they are prohibited from using escalators in stations where they are available. Bikes are allowed on the MTA's two suburban railroads (MNR and LIRR) except during peak hours in the peak direction, but cyclists must register in advance and purchase \$5 lifetime permits. Folding bikes are allowed at all times.

Bike-bus integration is almost non-existent in New York City. Not a single bus in the MTA's fleet of 5,929 buses has a bike rack. That contrasts sharply with 100 percent of buses equipped with bike racks in most of the other case study cities. Only since spring 2008 have folding bikes been allowed on most MTA buses.

There is no explicit effort to coordinate bike routes with transit routes in New York City. That is not a severe problem in most of the city because the transit network

is so dense that most neighborhoods are served by a nearby subway or bus line. In the suburbs and the outermost portions of the city, however, the complete lack of bike-transit route integration is a serious shortcoming. Precisely in those lower density areas where cycling would provide an ideal feeder mode to more distant transit stops, bikeways are almost exclusively recreational paths that do not connect to practical destinations such as transit stations.

Summary of Case Studies

Most of the case study cities have greatly improved the coordination of bicycling and public transport in recent years. They have increased bike parking at transit stops and better accommodated passengers wanting to take their bikes with them on buses and rail vehicles. Only a few transit systems have measured the actual extent of bike-and-ride, but the available evidence is encouraging. In Washington, DC, for example, the number of bicyclists riding on Metrorail increased by 60 percent between 2002 and 2007. At some stations, cyclists accounted for up to four percent of all passenger boardings. In Minneapolis, Metro Transit carries over 250,000 bicycles annually and reports a doubling of bikes on buses between spring 2007 and fall 2008. Roughly four percent of Portland MAX light rail passengers carry their bikes onto the vehicles with them. In the San Francisco Bay Area, the share of passengers accessing BART stations by bike rose from 2.5 percent in 1998 to 3.5 percent in 2008, with an average of 10,920 bike-and-ride trips per day.

As shown in Table 1, there is considerable variation among the eight case studies. The San Francisco Bay Area, for example, provides the full gamut of bike-integration measures and has been at the vanguard of innovations to promote bike-and-ride. By comparison, New York's transit systems have made few provisions to accommodate cyclists, lagging behind the other case study cities in both the quantity and quality of bike integration measures. All eight of the cities have plans to further improve bike-transit integration. Thus, it seems certain that the promising trends of recent years will continue.

Table 1. Overview of Bike-Transit Integration Measures in 8 Large American and Canadian Cities

Bike Parking at Transit Stops and Stations	Bikes on Transit		Bike Routes and Transit Stops	Highlights: Strengths and Challenges
	Bike Racks on Buses	Bikes on Trains		
SAN FRANCISCO (population city: 0.8m, metro: 4.2m)				
BART provides 4,313 bike parking spaces, including 716 conventional and 294 electronic bike lockers	All buses have bike racks (usage rates vary from 17 to 43%)	BART allows bikes on all non-peak trains and during peak times in non-peak directions. BART expanded on-board space for bikes on select cars	Bike routes often parallel MUNI bus routes and intersect with transit stops. No explicit planning process coordinating transit and cycling routes in SF	STRENGTHS: Racks on all buses; extra space for bikes on Caltrain cars; bike access to BART off-peak; extensive bike parking at BART and Caltrain stations; 5 bike stations
Caltrain's 32 suburban rail stations offer 400 bike racks and 1,100 bike lockers		Caltrain: special lead cars designated for bike use all day, space for 16-32 bikes	The Regional Bicycle Plan as well as the Bike Plans of BART and Caltrain encourage coordination of bike routes and facilities with public transport	CHALLENGES: No bike access on MUNI light rail; need more dedicated space for bikes on Caltrain; no coordination of bike routes with MUNI routes; no rush hour access for bikes on BART
Five bike stations with 659 bike parking spaces at BART and Caltrain Stations				
PORTLAND (population city: 0.5m, metro: 2.1m)				
Bike racks and/or lockers at almost all TriMet LRT stops and transit hubs providing 670 bike parking spaces; including 320 secured spaces	All buses have bike racks	MAX light rail: bikes permitted if space is available on cars, but passengers without bikes have priority	Explicit coordination of bike routes with transit stops with the goal of establishing a seamless link between the two modes	STRENGTHS: Racks on all buses; dedicated space on LRT for hanging bikes near doors; free access for bikes 24/7; easy access to low floor trains
15 downtown locations with bike lockers; usually close to light rail or bus stops				CHALLENGES: Lack of good quality and quantity of parking at most train stations; poor design of access to stations by bike; cyclists are often denied boarding on LRT during peak

Table 1. Overview of Bike-Transit Integration Measures in 8 Large American and Canadian Cities (cont'd.)

Bike Parking at Transit Stops and Stations		Bikes on Transit		Bike Routes and Transit Stops	Highlights: Strengths and Challenges
	Bike Racks on Buses		Bikes on Trains		
VANCOUVER (population city: 0.6m, metro: 2.1m)					
660 bike parking spaces in bike racks at SkyTrain stations and at transit transfer nodes	All buses have bike racks	SkyTrain: bikes allowed anytime except in peak periods in peak direction	Central Valley Greenway and BC Parkway facilitate access to and from transit stations	STRENGTHS: Bike racks on all buses; bikes allowed on SkyTrain except during peak hours in peak direction; integration of bike network and transit stops; bike parking at all major transit stops; 24/7 no cost bike access on SeaBus	
400 secure bike lockers at most Sky Train and all West Coast Express stations		SeaBus: bikes allowed at all times	Translink's \$2.55 million annual cost sharing of cycling infrastructure favors projects that facilitate access to transit	CHALLENGES: Need more and better bike parking; need more capacity on SkyTrain to accommodate cyclists	
MINNEAPOLIS (population city: 0.4m, metro: 3.2m)					
271 bike parking spaces and 226 bike lockers next to Metro Transit stops and at park and ride lots. Usage rate of 28% of bike parking spaces at Hiawatha LRT line	All buses have bike racks. Bike on bus demonstration racks in various locations	27 light rail vehicles with on-board interior vertical racks that accommodate 4 bikes per vehicle	No explicit coordination of bike routes and transit. But connection to transit lines is a prioritizing criterion for bike projects funded by the MPO	STRENGTHS: Bike racks on buses and trains; bike racks and lockers at most train stations; marketing information on bike transit integration provided by Metro Transit	
City bicycle ordinance encourages parking bikes at sign posts, which are within a block of most bus stops. Bike station 1/10 of a mile from the Chicago and Lake Street transit hub			The Hiawatha LRT line parallels an off-street bike path for most of its length in Minneapolis	CHALLENGES: Bike racks needed at four more LRT stations; lack of bike paths and lanes leading to train stations and bus stops	

Table 1. Overview of Bike-Transit Integration Measures in 8 Large American and Canadian Cities (cont'd.)

Bike Parking at Transit Stops and Stations	Bikes on Transit		Bike Routes and Transit Stops	Highlights: Strengths and Challenges
	Bike Racks on Buses	Bikes on Trains		
CHICAGO (population city: 2.7m, metro: 9.5m) 2,153 bike parking spaces at 131 of the 143 CTA stations and 4,267 bike parking spaces at 50 of the 76 METRA suburban rail stations. Most (83) CTA stations provide indoor or sheltered bike parking. Usage rates of 90% and 50% for indoor and outdoor racks Largest bike station in the USA with indoor parking for 300 bikes, right above the terminal station for two of Chicago's suburban rail lines	All CTA and PACE buses have bike racks	Bikes permitted on CTA and METRA trains during off-peak. Bikes not permitted on escalators in stations	The routing of on-street bikeways in Chicago takes the location of transit stations into account. CTA system maps show bike parking possibilities at stations	STRENGTHS: Ample bike parking at 131 CTA stations, of which 83 provide indoor parking. State-of-the-art Millennium bike station at downtown terminus of suburban rail line; CTA regularly collects bike rack usage data to add parking where needed CHALLENGES: The CTA subway is old with limited ADA facilities; flights of stairs make it difficult to bring bikes on board
TORONTO (population city: 2.5m, metro: 5.5m) 1,771 short-term bike parking spaces and 114 bike lockers at TCC subway and GO Transit stations	55% of TTC buses and all GO Transit buses have bike racks	Bikes permitted on TTC subways, RT trains, streetcars, and buses without bike racks except during peak hours	The guiding principle of bike facility planning is to put every resident with a 5 minute bike ride of the bike network	STRENGTHS: Extensive transit system with high mode share; bike racks on most buses; bikes allowed off-peak on streetcars, subways, and suburban rail; bike parking at most transit stops CHALLENGES: No bikes allowed on rail transit during peak hours; lack of elevators in many stations; more bike parking and secure lockers needed at stations; no coordination of bike routes with transit stops
New bike station at Union Station (opening spring 2009) with secure, sheltered parking for 200 bikes. Second bike station planned	All TTC buses will be equipped with bike racks by end of 2010	Bikes permitted on GO Transit trains except on trains arriving at and departing from Union Station in peak direction	The Waterfront Trail which spans the Greater Toronto Area parallels the busy GO Rail Lakeshore corridor and is in close proximity to many stations	

Table 1. Overview of Bike-Transit Integration Measures in 8 Large American and Canadian Cities (cont'd.)

Bike Parking at Transit Stops and Stations		Bikes on Transit		Bike Routes and Transit Stops	Highlights: Strengths and Challenges
		Bike Racks on Buses	Bikes on Trains		
WASHINGTON, DC (population city: 0.6m, metro: 5.3m)					
1,800 bike racks and 1,300 bike lockers at Metro stations. No bike parking at bus stops, except major transit hubs with rail stations		All WMATA buses have bike racks	Bikes allowed on Metro trains during off-peak. Cyclists must use elevators between the street and the station platforms	Drafting of DC bike plan took the location of metro stops into account, particularly for the bike route network and facility recommendations	STRENGTHS: Bike racks on all buses; bikes on Metro except during peak; lockers and racks at all stations; SmartBike short-term rentals at 8 Metro stations
Bike station for 150 bikes opened in October 2009 at Union Station			Bikes not allowed on MARC trains. VRE allows bicycles on some trains		CHALLENGES: Restricted bike access hours on Metro; bikes restricted on VRE and MARC suburban rail
NEW YORK CITY (population city: 8.2m, metro: 18.8m)					
No dedicated bike parking at rail stations or transit terminals. Some bike parking provided by NYCDOT on sidewalks, often near transit stops.		No buses with bike racks in NYC	Bikes permitted on the NYC subway at all times, but only 16% of stations ADA accessible, with elevators or ramps	No explicit coordination; but the transit network in the city is so dense that most of the bike network is close to transit	STRENGTHS: 24/7 bike access and no fees or permits on NYC subway system, most extensive in North America
No secure bike parking of any kind in NYC					
Bike parking provided at only a third of MTA suburban train stations in New York; bike lockers at 18 LIRR and 6 MNR stations			All suburban trains allow bikes on board during off-peak hours, but limit of 2-4 bikes per car on weekdays	No coordination of bike network with transit stations and routes in suburbs; most suburban cycling facilities are recreational and do not lead to transit stops	CHALLENGES: No bike racks on MTA buses in NYC; limited parking at MTA suburban rail stations and no bike parking at two main train stations in Manhattan; no secure bike parking; difficult to access platforms: only 16% of subway stations with elevator access

Conclusions and Policy Implications

North American cities have been making impressive progress integrating cycling with public transport. Since 2000, the percentage of buses with bike racks has almost tripled. Bike-rail integration has also advanced. Most light rail, metro, and suburban rail systems permit bikes on their rail vehicles except during peak hours, and they increasingly provide special accommodations for cyclists such as bike hooks, racks, and rails in special areas of rail cars. Complementing provisions for bikes on transit vehicles, bike parking at transit stops has been vastly expanded over the past 10 years, with large increases in the number of racks as well as improvements in the convenience, security, and shelter of bike parking.

While cycling and public transport have considerable synergies, there are some inevitable conflicts. Surveys in some cities indicate that cyclists prefer to take their bikes with them on rail vehicles so they can use them at both ends of the trip. That can cause problems during peak hours, however, when all available capacity is needed to accommodate passengers and there is no extra room for bikes. Taking bikes on buses is much less of a problem since bike racks are external and do not reduce passenger-carrying capacity. But even bike racks can be filled to capacity during the peak, forcing cyclists to wait for later buses.

Paradoxically, bike-and-ride can become problematic where it is most successful. Capacity problems are most likely to arise in cities with well-used public transport and high levels of cycling. That is why the European approach to bike-and-ride has favored the provision of ample, sheltered, secure bike parking at transit stops instead of accommodating bikes on transit vehicles. Similarly, in North American cities with overcrowding of rail vehicles during rush hours, the focus should probably be on providing improved bike parking at rail stations. Not only is more parking needed, but it should be of higher quality, with more sheltered and secure spaces. Major transit terminals should include multi-service bike stations, such as those in northern Europe. Similar to the concept of “complete streets,” an appropriate goal of transit systems in North America should be to provide “complete stations,” which fully accommodate the needs of cyclists. That includes making rail platforms more accessible to cyclists, which would also improve accessibility for persons with disabilities.

Such bike-and-ride provisions cost money, but they are much cheaper than park-and-ride facilities for motorists (TRB 2005). Transit systems should shift their focus from park-and-ride to bike-and-ride, which is more cost-effective as well as more environmentally friendly. To encourage that shift, federal, state, and local

government agencies should vastly expand funding for further improvements in bike-and-ride measures.

Acknowledgments

The research project on which this paper is based was funded by a grant from the Research and Innovative Technology Administration of the U.S. Department of Transportation. John Neff (American Public Transportation Association), Andy Clarke (League of American Bicyclists) and Gabe Rousseau (U.S. Department of Transportation) provided valuable information and advice on all aspects of the paper. The authors are deeply indebted to the many bicycling experts and transit planners who provided us with detailed information and feedback for the eight case study cities. We list them here grouped by city: San Francisco (Nick Carr, Deirdre Weinberg, Heath Maddox, Laura Timoth, Sarah Syed, Dave Snyder, Leah Shahum, Andy Thornley); Portland (Mia Burke, Roger Geller, Colin Maher); Vancouver (Gavin Davidson); Minneapolis (Shaun Murphy, John Siqveland, James Andrew, Barb Thoman, Tony Hull, Joan Pasiuk); Chicago (Randy Neufeld, Daniel Thomas, Ben Gomberg, Chris Gagnon); Toronto (Dan Egan, Adam Giambrone, Sean Wheldrake, Jennifer Niece, Jana Neumann); Washington (Jim Sebastian, Eric Gilliland, Christine Haldeman, Paul DiMaio); and New York (John Kaehny, Charles Komanoff, Noah Budnick, Caroline Samponaro, Joseph Chan, Ryan Russo, and Joshua Benson).

About the Authors

JOHN PUCHER (pucher@rutgers.edu) is a Professor in the Bloustein School of Planning and Public Policy at Rutgers University in New Brunswick, New Jersey. He specializes in comparative research on transport systems, travel behavior, and public policies in the United States, Canada, and Europe. Over the past 12 years, his research has focused on walking and cycling and how public policies could be improved to encourage these most sustainable of all modes of transport. Currently, he is principal investigator of a research project for the U.S. Department of Transportation examining bicycling trends and policies in large American cities.

RALPH BUEHLER (ralphbu@vt.edu) is an Assistant Professor in the Urban Affairs and Planning Program at Virginia Tech's Alexandria Center. His research seeks to disentangle how international differences in travel behavior are shaped by public policies, spatial development patterns, and demographic and socioeconomic factors. The main goal is to determine what countries can learn from each other to improve the sustainability of their urban transportation systems. Together with Pucher, he is co-principal investigator of a research project for the U.S. Department of Transportation examining bicycling trends and policies in large American cities.
